March, 2026

CERTIFICATE

This is to certify that the Practice School-II report entitled "**Integrated Logistics Operations and Documentation Management System**" submitted by **Aishani Goyal (2022BTech007)** towards the partial fulfillment of the requirements for the degree of **Bachelor of Technology in Computer Science and Engineering** of JK Lakshmipat University Jaipur is the record of work carried out by her under my supervision and guidance. In my opinion, the submitted work has reached a level required for being accepted for Practice School-II examination.

Ms. Supriya Mishra
Faculty Supervisor

Assistant Professor, Department of Computer Science & Engineering
Institute of Engineering & Technology
JK Lakshmipat University, Jaipur

Dr. Pranab Roy
PS-2 Coordinator

Associate Professor, Department of Computer Science & Engineering
Institute of Engineering & Technology
JK Lakshmipat University, Jaipur

Date of Submission: 6 March 2026

ACKNOWLEDGEMENTS

I would like to express my sincere gratitude to all those who have contributed to my learning and experience during my Practice School-II.

First and foremost, I am thankful to **Kritika Infotech** for providing me with the opportunity to gain practical exposure to real-world software development and digital solutions. The guidance and support from the team at Kritika Infotech have been extremely valuable in helping me understand industry practices and apply my technical knowledge in a professional environment.

I would like to extend my heartfelt thanks to my industry mentor, **Mr. Mukesh Bhati**, for his continuous guidance, encouragement, and insightful feedback throughout the internship so far. His mentorship and practical insights have greatly contributed to my learning and development during this period.

I am also grateful to JK Lakshmipat University, Jaipur, especially the faculty of the Computer Science and Engineering department, for providing the academic foundation necessary to undertake this internship. I would like to express my special thanks to my faculty supervisor, **Ms. Supriya Mishra**, for her constant support, guidance, and encouragement during this internship.

Lastly, I would like to thank everyone who has supported and motivated me during this internship and contributed, directly or indirectly, to my learning experience.

Aishani Goyal
(2022BTech007)

ABSTRACT

This report presents the work carried out during the ongoing internship at Kritika Infotech, where the primary focus is on the design and development of a structured digital system for managing export shipment operations. The internship provides practical exposure to real-world software development practices, system design, and workflow automation within an industry environment.

The project aims to develop a centralized logistics management platform that digitizes and organizes export shipment workflows. The proposed system integrates booking management, shipment tracking, documentation handling, and partner management into a unified application. By replacing manual processes such as spreadsheets, emails, and document templates, the system aims to improve operational efficiency, reduce repetitive data entry, and enhance visibility across different stages of shipment processing.

The system is being designed using modern web technologies and a relational database architecture to ensure structured data management, scalability, and secure role-based access. Key functionalities include organized storage of operational records, automated document handling, centralized partner management, and structured shipment status tracking.

As the internship is currently in progress, this report summarizes the project background, problem analysis, proposed system design, database structure, and the initial development approach undertaken during the internship period so far. The experience gained through this internship contributes to strengthening practical skills in system design, backend development, and real-world software implementation.

CHAPTER 1: ABOUT THE ORGANIZATION

Kritika Infotech is an IT service provider established in 2009 that offers web hosting, web development, and digital infrastructure solutions. The company focuses on helping businesses build a reliable online presence through secure, scalable, and cost-effective technology services. It supports startups, SMEs, and enterprises by providing end-to-end digital solutions for their online operations.

1.1 GOALS & MISSIONS

- The main mission is to provide reliable, secure, and innovative digital solutions that support business growth.
- A key goal is to help businesses establish a strong and efficient online presence through scalable digital infrastructure.
- Another goal is to become a trusted technology partner by delivering high-quality IT services and dependable customer support.
- The organization's mission also focuses on ensuring customer satisfaction through affordable services, reliable hosting, and modern technology solutions.

1.2 SERVICES & PRODUCTS OFFERED

Kritika Infotech offers a range of IT and digital services that help businesses establish and manage their online presence. The major services provided by the company include:

1. **Web Hosting Services:**
   Provides various hosting solutions such as shared hosting, reseller hosting, VPS hosting, and dedicated servers to ensure secure website hosting, reliable performance, and high uptime.
2. **Domain Registration:**
   Offers domain registration and management services that help businesses create and maintain their unique online identity.
3. **Website Design and Development:**
   Develops responsive and user-friendly websites and web applications using modern technologies to meet business requirements.
4. **Digital Marketing and SEO:**
   Provides digital marketing services including Search Engine Optimization (SEO) and Social Media Optimization (SMO) to enhance online visibility and audience reach.
5. **Email and Cloud Solutions:**
   Offers business email services, cloud hosting, and digital infrastructure solutions to support secure communication and efficient data management.

CHAPTER 2: INTRODUCTION

2.1 PROJECT BACKGROUND

This project is being developed for a client organization operating in the logistics and export shipment management sector. The logistics industry involves the coordination of multiple operational activities such as shipment bookings, documentation handling, partner coordination, and shipment tracking. These activities require collaboration between different stakeholders including exporters, shipping lines, transporters, and documentation teams. As operational volumes increase, managing these interconnected processes through manual methods can become complex and inefficient, highlighting the importance of structured digital systems to support logistics operations.

2.2 PROJECT OVERVIEW

The project titled "Integrated Logistics Operations and Documentation Management System" focuses on designing and developing a centralized digital platform to manage and organize export shipment operations. The system aims to provide a structured framework for handling operational data related to bookings, shipments, logistics partners, and associated documentation. By bringing these components into a unified platform, the system supports better organization of operational workflows and improves the overall management of logistics processes within the organization.

2.3 PROBLEM STATEMENT

In the existing operational environment, many logistics and export shipment activities are managed using manual methods such as spreadsheets, email communication, and document templates. Operational information is often distributed across different files and communication channels, which creates several challenges.

Some of the key issues in the current workflow include:

- Repetitive manual data entry across multiple records
- Difficulty in tracking shipment progress and operational status
- Lack of centralized storage for operational data and documents
- Limited visibility of workflow progress across different stages

These limitations highlight the need for a centralized system that can organize and streamline logistics operations more effectively.

2.4 PROPOSED SOLUTION

To address the identified challenges, the project proposes the development of a centralized digital platform that integrates multiple logistics operations within a structured system.

The proposed system will:

- Integrate booking entry, shipment tracking, and documentation management into a unified workflow
- Maintain organized records of exporters, shipping lines, transporters, and other logistics partners
- Provide structured storage and management of operational documents
- Enable tracking of shipment status at different stages of the workflow
- Support controlled system access through role-based user management

This centralized approach helps reduce manual effort and improves coordination across operational activities.

2.5 PROJECT OBJECTIVES

The main objectives of the 'Integrated Logistics Operations and Documentation Management System' are:

- To streamline export shipment operations through a centralized workflow system
- To maintain organized and reliable storage of operational data and records
- To reduce manual effort through structured documentation and process management
- To improve visibility and monitoring of shipment status and operational activities
- To ensure secure system access through role-based user control

2.6 PROJECT SCOPE

The scope of this project includes the design and development of a digital platform that manages key operational components related to logistics and export shipments.

The system focuses on:

- Management of logistics partner information
- Handling of booking and shipment records
- Structured management of operational documents
- Workflow tracking and coordination across different operational stages

As the internship is currently ongoing, the system is being developed in phases, beginning with core modules and gradually expanding toward workflow automation and advanced operational features.

CHAPTER 3: TOOLS & TECH STACK USED

The development of the Integrated Logistics Operations and Documentation Management System utilizes a modern full-stack technology stack to support scalable application development, efficient data management, and reliable deployment. The selected tools help ensure maintainability, modular development, and efficient handling of logistics operational data.

3.1 FRONTEND TECHNOLOGIES

Technology Stack	Role in the Project
React + TypeScript	Used to develop the interactive user interface for system modules such as user management, logistics partners, bookings, and shipments.
Tailwind CSS + shadcn UI	Used for designing responsive layouts and reusable UI components such as forms, tables, and dialogs.
Vite	Used as the frontend development and build tool for running the application and bundling assets.

3.2 BACKEND TECHNOLOGIES

Technology	Role in the Project
Node.js	Provides the runtime environment for executing backend application logic and APIs.
Express.js	Used to build REST APIs for handling requests related to users, logistics partners, bookings, and shipments.

3.3 DATABASE AND ORM

Technology	Role in the Project
PostgreSQL	Stores structured operational data including users, logistics partners, bookings, containers, and shipment records.
Prisma ORM	Used to manage database schema, queries, and relationships between entities.

3.4 CLOUD AND STORAGE SERVICES

Technology	Role in the Project
Render	Used for deploying and hosting backend services of the application.
AWS S3	Used for storing uploaded operational documents such as booking copies, invoices, and shipment files.

3.5 DEVELOPMENT AND TESTING TOOLS

Tool	Role in the Project
Postman	Used for testing backend APIs and verifying request-response flows.
Git & GitHub	Used for version control and managing project codebase.

CHAPTER 4: ROLES AND RESPONSIBILITIES

During the internship, the role involved contributing to the development of a software solution designed to manage logistics operations and documentation workflows. The work focused on understanding business processes and supporting the implementation of system modules as part of the application development process.

4.1 PROJECT INVOLVEMENT

The internship work is focused on contributing to the development of the Integrated Logistics Operations and Documentation Management System. This involves understanding operational workflows and assisting in the design and development of the system. Key areas of involvement include:

- Understanding logistics operational workflows
- Analyzing existing processes and identifying improvement areas
- Assisting in system architecture and database design
- Supporting development of application modules

4.2 KEY RESPONSIBILITIES

The main responsibilities during the internship include contributing to different stages of the software development process while ensuring alignment with project requirements.
Key responsibilities include:

- Understanding functional requirements and translating them into system components
- Contributing to the implementation of frontend and backend application modules
- Developing and testing system features related to logistics partners, bookings, and shipments
- Participating in iterative development and incorporating feedback into system improvements
- Supporting the development of a structured and scalable solution for managing logistics operations

These responsibilities provide practical exposure to real-world software development practices and helped in applying technical knowledge to develop a structured digital solution for operational workflow management.

CHAPTER 5: WORK DONE

5.1 INTERNSHIP WORK DONE SO FAR

This section describes the work completed during the internship period for the development of the 'Integrated Logistics Operations and Documentation Management System'. The work primarily involved understanding logistics workflows, designing the system architecture, defining the database schema, and beginning the implementation of the web application interface.

The development process followed a structured approach that included requirement understanding, system design, database planning, UI development, and component integration.

5.1.1. Understanding the Client's Logistics Workflow

The initial phase of the internship focused on understanding the operational workflow followed by the client organization in managing international logistics operations. Since the project involves developing an 'Integrated Logistics Operations and Documentation Management System', it was essential to study how shipment documentation, cargo movement, and operational coordination are handled within the company.

The study involved reviewing the client's logistics processes, documentation practices, and shipment handling procedures used during international freight forwarding. This analysis helped in identifying the core operational stages that the system must support digitally.

During this phase, the following key logistics elements relevant to the client's operations were analyzed:

- **Bill of Lading (BL)** – A critical shipping document used by the client to confirm that cargo has been received by the carrier and is ready for transportation. It also acts as a contract between the shipper and the carrier.
- **Incoterms (International Commercial Terms)** – Standardized international trade terms that define the responsibilities of buyers and sellers regarding transportation costs, risk transfer, and delivery obligations. These terms are used by the client while handling international shipments.
- **Shipment Tracking** – Monitoring the movement of cargo from the point of origin to the final destination. The client currently relies on multiple systems to track shipment status, which highlighted the need for a centralized digital platform.
- **Cargo Documentation Management** – The client manages several documents such as shipping instructions, cargo details, and shipment records. Digitizing this documentation process was identified as an important requirement for improving operational efficiency.

By studying these operational components, the core modules required for the logistics management system were identified. These modules include shipment management, documentation management, cargo tracking, and operational monitoring, which form the

foundation of the system being developed during the internship.

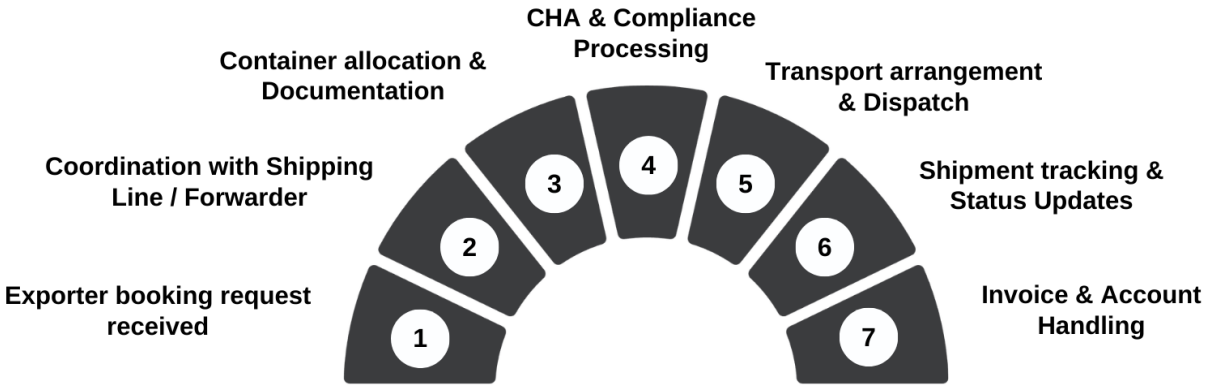

Figure 5.1 Logistics Workflow Overview

5.1.2 Requirement Analysis

After understanding the client's logistics workflow, the next step involved performing a requirement analysis to identify the system functionalities needed to support the client's operational processes. The objective of this phase was to convert the client's manual and partially digital workflows into a structured software system that can manage shipments, documentation, and operational tracking efficiently.

Discussions with the mentor and analysis of the client's working process helped identify the operational challenges and define the system requirements.

a. Existing Process and Challenges

Currently, many operational activities within the client's logistics workflow are managed using multiple tools, spreadsheets, and manual documentation handling. This approach leads to inefficiencies and increases the chances of errors.

The following key challenges were identified:

- Scattered shipment data across spreadsheets and emails.
- Manual document handling, making document retrieval slow.
- Lack of centralized shipment tracking.
- Limited visibility of shipment status across operations teams.
- Difficulty in managing logistics partner information such as carriers, agents, and ports.

These challenges highlighted the need for a centralized logistics operations system that can integrate shipment management, documentation, and operational monitoring into a single platform.

b. Functional Requirements

Based on the workflow analysis, the following core system functionalities were identified for the client's logistics management system.

Module	Description
User Authentication & Role Management	Secure login system with role-based access for different users such as administrators and operations staff.
Master Data Management	Maintain structured data for logistics partners including shipping lines, ports, customers, and agents.
Shipment Booking Module	Allow operations team to create and manage shipment bookings with cargo details and customer information.
Shipment Tracking & Status Management	Track shipment progress and update shipment status during different stages of the logistics process.
Document Upload & Storage	Upload and store shipment-related documents in a centralized digital repository.
Documentation Workflow (Planned)	Automate the generation and management of key logistics documents such as BL Draft and VGM.
Dashboard & Monitoring	Provide a dashboard view showing active shipments, recent bookings, and operational updates.

Table 5.1 Functional Requirements

These modules form the Minimum Viable Product (MVP) of the logistics management system being developed during the internship.

c. Non-Functional Requirements

Apart from system functionality, certain technical and operational requirements were also considered to ensure that the system performs efficiently and can scale with the client's operations.

Requirement	Description
Scalability	The system should support increasing shipment volumes as the client's operations grow.
Security	Secure authentication and controlled access to sensitive shipment and document data.
Performance	Fast data retrieval for shipment records and documents.
Usability	Simple and intuitive user interface for operations teams.
Data Reliability	Ensure accurate storage and retrieval of logistics data.

Table 5.2 Non-Functional Requirements

5.1.3. System Architecture Design

The system follows a modular web application architecture, where the application is divided into separate layers responsible for handling different tasks. This layered approach improves maintainability and makes the system easier to scale and extend in future phases.

The architecture primarily consists of the following layers:

- **Frontend Layer** - Provides the user interface through which operations teams interact with the system. It allows users to manage shipments, update status, upload documents, and view dashboards.
- **Backend Layer** - Handles the core business logic of the system including authentication, shipment processing, document management, and API handling.
- **Database Layer** - Stores structured data related to shipments, logistics partners, users, and documents.
- **Cloud Storage Layer** - Stores uploaded shipment documents securely and allows easy retrieval when required.

This architecture enables separation of concerns, where each layer performs specific responsibilities while interacting through well-defined APIs.

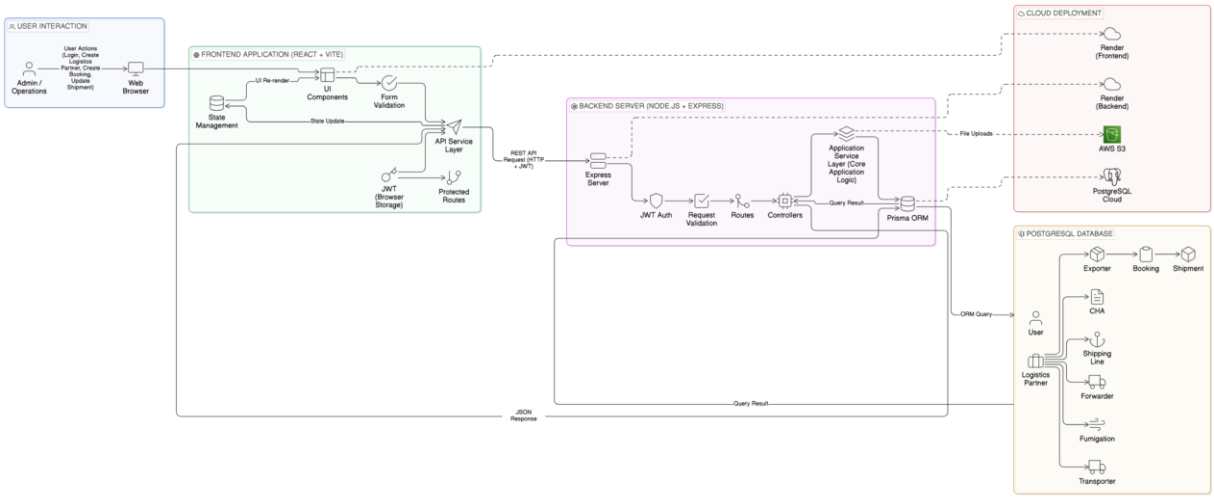

Figure 5.2 System Architecture Diagram

5.1.4. Database Schema Design

A structured relational database design was adopted to ensure efficient storage, retrieval, and management of logistics data such as shipment details, logistics partners, booking information, and documents. The schema focuses on maintaining relationships between shipments, users, partners, and documentation records to ensure data consistency and traceability across the system.

Based on the system requirements, several key entities were identified and implemented in the database schema. These entities represent the core operational components of the logistics management system.

1. Stakeholder & User Management: Manages internal staff (via the users table) and external entities (via logistics_partners). It uses normalized extension tables like logistics_partner_emails and exporter_details to store specific contact and regulatory data (e.g., IEC, Bank AD codes).

2. Booking Lifecycle: The bookings table acts as the central transaction hub, linking exporters to service providers. It tracks critical timeline data, such as estimated departure, and serves as the bridge between client purchase orders and logistics execution.

3. Physical Asset Tracking: Using a one-to-many relationship, the booking_containers table tracks individual transport units. It captures granular hardware details (size/type) and "last-mile" data, including driver and vehicle identification.

4. Shipment Execution & Finance: The shipments table formalizes the transition from a request to an active job. It assigns unique job numbers for operational tracking and stores invoice references to integrate with the system's financial and accounting modules.

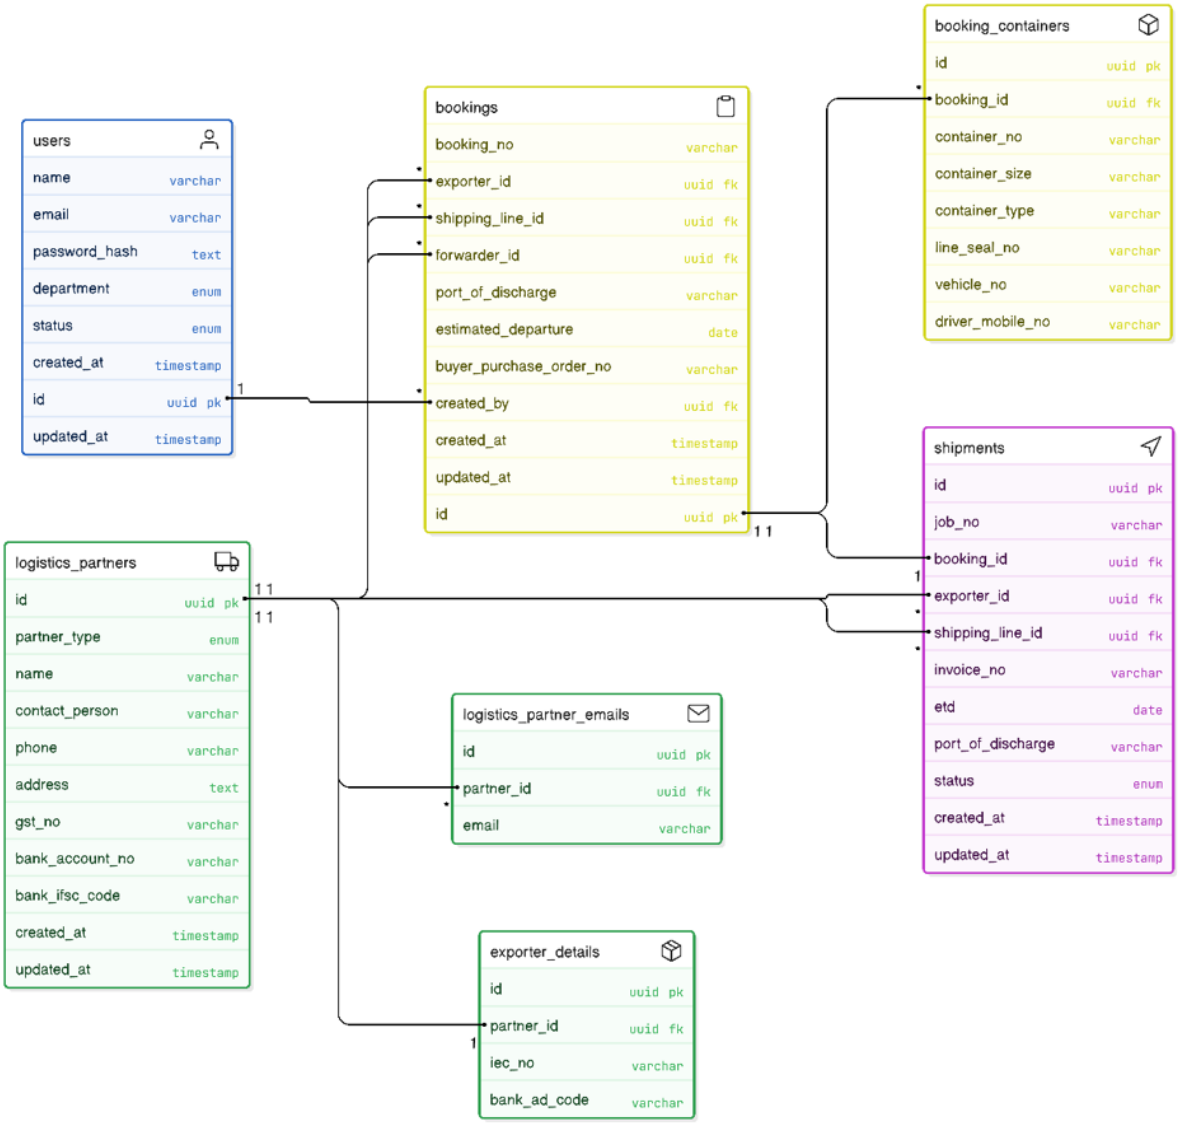

Figure 5.3 Database Schema

5.1.5 User Interface Development

The User Interface (UI) of the Logistics Management System is developed using React, shadcn/ui to provide a clean, responsive, and user-friendly interface for managing logistics operations. The UI emphasizes simplicity, efficient navigation, and role-based access to ensure secure and smooth workflow management.

Key Interface Components

- **Dashboard** - Central hub showing shipment summaries, pending tasks, and key statistics with quick navigation to other modules.
- **Shipment Management Page** - Allows creation, update, and tracking of shipments.
- **Booking Module** - Captures booking details and container information, including exporter/importer data, shipment dates, and cargo specifics.
- **Document Upload Section** - Enables uploading of invoices, packing lists, BL/SI, and other shipment documents.
- **Shipment Tracking Interface** - Displays real-time shipment status across different operational stages.

Reusable UI components such as navigation menus, tables, buttons, and forms ensure consistency and efficiency throughout the application.

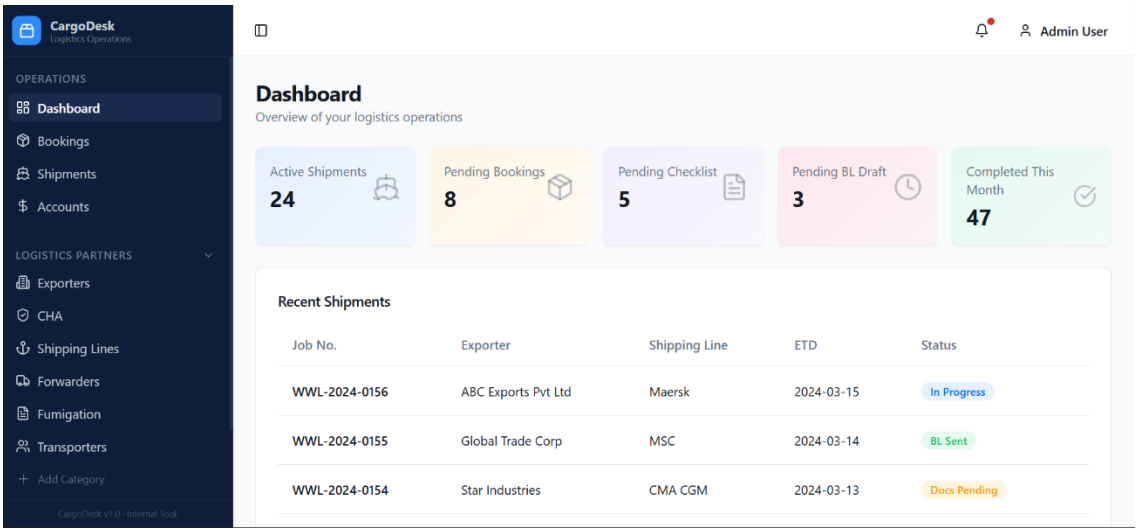

Figure 5.4 Application Dashboard Interface

The dashboard provides a centralized view of logistics operations, showing shipment summaries, key statistics, and quick access to other modules for efficient workflow management.

5.1.6 Booking and Master Data Management

The Booking and Master Data Management modules provide a centralized interface for handling shipment bookings and managing logistics partners. These modules ensure accurate data entry, centralized storage, and easy access to all critical operational information.

Key Features:

1. **Booking Module**
   - Handles complete shipment booking, including exporter/importer details, shipment dates, cargo description, and container information.
   - Supports document uploads for invoices, packing lists, BL/SI, and other required files.
   - Validation rules ensure that all booking and container details are complete and accurate.

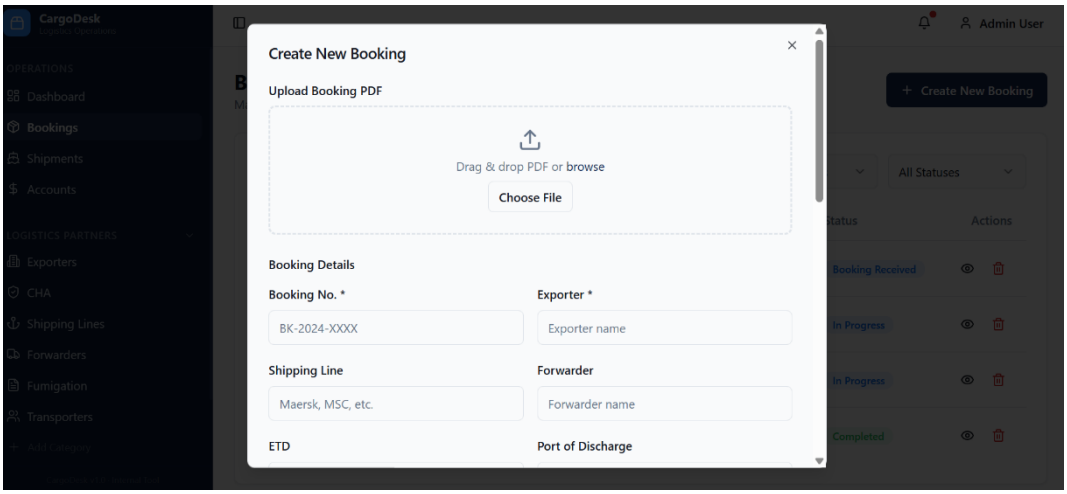

Figure 5.5 Booking Creation Interface

2. **Master Data Module**

   Maintains records of all key logistics partners involved in operations. The six partner categories include:

   1. **Exporters** – Companies sending shipments.
   2. **Customs Handling Agents (CHA)** – Agents managing customs clearance.
   3. **Transporters** – Companies handling cargo movement.
   4. **Fumigation Companies** – Agencies providing fumigation services.
   5. **Shipping Lines** – Organizations providing vessel services.
   6. **Forwarders** – Freight forwarding partners.

   Each category is maintained in a table format for quick reference, filtering, and management.

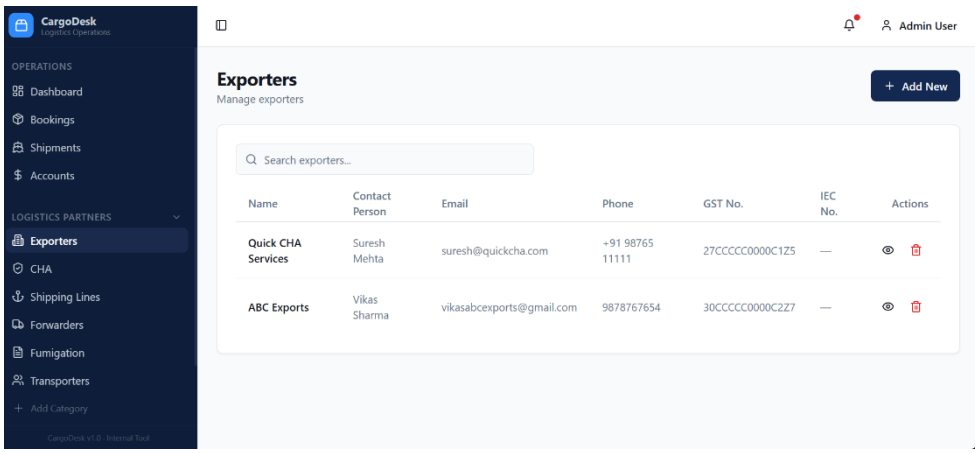

Figure 5.6 Logistics Partner - Exporters Management

5.2 WEEK-WISE LOG

Week No.	Objective	Activities Conducted	Feedback / Modifications
Week 1 15 Jan – 21 Jan 2026	Onboarding & Client Domain Understanding	- Attended introductory meeting with mentor - Understood organization's services and workflow - Briefed on client project requirements - Reviewed client's export process and key challenges	- Document workflow before planning - Follow MVP approach
Week 2 22 Jan – 31 Jan 2026	Requirement Analysis & Module Planning	- Mapped workflow into modules - Defined user roles & RBAC - Prepared requirement draft - Finalized tech stack	- Prioritized Booking module - Moved automation features to Phase 2
Week 3 2 Feb – 7 Feb 2026	Architecture & Backend Planning	- Designed system architecture - Created database schema - Planned API endpoints - Structured backend modules	- Added status tracking - Refined role hierarchy
Week 4 9 Feb – 14 Feb 2026	Database & UI Structure	- Implemented database tables - Defined relationships - Designed dashboard layout - Structured booking & shipment UI	- Simplified UI layout - Improved schema design
Week 5 16 Feb – 21 Feb 2026	Core Module Development (MVP)	- Implemented authentication - Developed Master Data CRUD - Built Booking module - Integrated document upload & storage functionality - Implemented core Shipment module (creation, listing, status tracking)	- Initiate documentation workflow design post-MVP - Define templates and automation roadmap

Week 6 23 Feb – 28 Feb 2026	MVP Refinement & Documentation Workflow Planning	- Reviewed and improved MVP modules based on feedback - Refined booking, shipment, and logistics partner data management - Improved UI structure and validation logic - Initiated planning for documentation workflow automation (BL Draft, VGM, etc.)	- Continue refining MVP modules - Define document templates and automation logic - Prepare structured workflow for document generation

CHAPTER 6: FUTURE PLAN

5.1 AUTOMATION IMPLEMENTATION

The next stage of development will focus on implementing automation features to streamline the operational workflow of the system. This includes automating the generation and management of key logistics documents and reducing manual intervention in routine tasks.

Planned activities include:

- Automation of BL Draft, SI, and VGM document workflows
- Development of automated draft email generation for CHA, fumigation, and shipment communication
- Implementation of checklist upload and validation mechanisms for documentation processes

5.2 ADVANCED SYSTEM ENHANCEMENTS

Further improvements will focus on introducing intelligent document processing and operational monitoring features that enhance efficiency and provide better visibility into system operations.

Key enhancements include:

- Integration of PDF data extraction and AI-based field detection
- Development of reports dashboard and monitoring features for operational insights
- Implementation of automated notifications and communication services

5.3 SYSTEM TESTING AND DEPLOYMENT PREPARATION

Before final deployment, the system will undergo testing and optimization to ensure reliability and performance.

Activities in this stage include:

- End-to-end system testing and workflow validation
- Performance optimization and security checks
- Preparation for production deployment and system documentation

CHAPTER 7: CONCLUSION

6.1 INTERNSHIP EXPERIENCE

The internship at Kritika Infotech has provided practical exposure to real-world software development practices and enterprise application development. It has allowed the application of academic knowledge to solve real business problems through the development of a structured digital system.

6.2 TECHNICAL LEARNING AND CONTRIBUTIONS

During the internship, work has been carried out on the development of the Integrated Logistics Operations and Documentation Management System, which involved understanding operational workflows and translating them into system modules. Key contributions include assisting in system architecture design, database schema creation, and development of core modules such as authentication, logistics partner management, booking, and shipment tracking.

6.3 FUTURE LEARNING OPPORTUNITIES

As the internship continues, the next stages of development will focus on automation features, advanced document processing, and system optimization. These phases will provide further opportunities to strengthen practical knowledge in full-stack development, system integration, and enterprise workflow automation.
